## FROM DESIGN TO MAPPING, YOUR COMPLIANCE STARTS HERE

Maintaining compliance with pipeline warning sign regulations can be an onerous task – the number of road, trail, railway or water crossings can add up along the length of any pipeline.

Add the responsibility for sign maintenance and relocation and it becomes easier to see why many Alberta pipeline owners fall short of compliance.

We can make it easier.

First, we manufacture the signs printed with your company logo. Then, we determine the crossing locations and our trained pipeline locators sweep the area and install the signs – using

a low-impact, hydrodig process where possible.

Once installed, we verify each location using GPS equipment and add the information to our user-friendly, Web-based mapping system – AbaData.

The result: Your company is in compliance with warning sign regulations and has a GIS database containing each sign location, including inspection forms, images of each sign and verification dates. Or, if you prefer physical maps to a Web-based system, we can offer that as well.

Contact us to discuss the details.
